FAQ – How can I change the sandwich panel properties or add new sandwich panels to **SandStat**?

SandStat contains a module with which you can change existing sandwich panel characterstics or integrate a new element. This module is not included in the basic version and should be purchased separately.

General procedure

Definition of design procdure (depending on license)

Selection of the sandwich panel to be calculated

iS - engineering GmbH 🔤

Explanatory notes

In the dialog "Sandwich panel selection" the menu item "Element Entry" is visible, if the module is purchased and activated:

cincle cincy

Index "Upper face layer"

3. Freie Elementeingabe					
General details	Upper face layer	Lower face layer	core	partial safty factors	fixings
Geomtry (1) nominal thickness of face (N1 = mm §	Zinkschichtdicke zinc1 = mm 🛠	cross-sectional area A1 = cm²/m	moment of inettia I1 = cm^4/m	distance between centroids d11 = c	of 112 = mm
im Feld w1f = N/mm ²	über der Stütze w1s = N/mm²	in span T elevated w1f+ = N/mm²	above support T elevated w1s+ = N/mm²	reduction from k = (fasteners / m with n) /
name	modulus of elasticity E = N/mm²	coefficient of thermal $\alpha T = 17^{\circ}$	yield strength ft = N/mm²	bulk density rhoM = kg/m²	Creeps
		cancel			add

	Geometry	
•	tN1	Nominal sheet thickness (thickness including zinc coating) in mm
•	zinc1	Zinc layer thickness in mm (usually 0.04 mm)
•	*	Tool for determining the cross-section values (nominal sheet thickness and zinc layer thickness must be defined beforehand; for explanation please refer to the following pages)
•	A1	Cross-sectional area (without zinc layer = netto cross-sectional area) in cm ² /m

iS - engineering GmbH

	Wrinkling s	stresses -> charakteristic value in [N/mm ²]
•	Sw1f	in span
•	Sw1s	at support
•	Sw1f+	in span with a temperature of face layer above 20°C
•	Sw1s+	at support with a temperatur of face layer above 20°C
	reduction	Reduction of wrinkling stresses as a function of the number of fasteners (usually with flat or lightly profiled faces)
	Material	
•	name	designation of material
•	E	E-modulus of outer face layer (steel: 210 000 N/mm ²)
•	аТ	coefficient of thermal expansion of outer face layer (steel: 0,000012 1/°)
•	ft	charakteristic yield strength of outer face layer in N/mm ²
•	rhoM	bulk density of outer face layer (steel: 8000 kg/m ³)
•	B	The cross-sectional values are adapted to changes in the nominal sheet thickness.
•	creeps	The outer surface layer consists of a material which can creep (e.g. GRP surface layers).
		Further information is required (modulus of elasticity long-term, yield strength long-term etc.).

iS - engineering GmbH 🗖

Tool for determining the cross-section values

The cross-section values of the surface layer can be calculated in the following tool:

🔄 Profil Genera	ator					×
				Thickne	ss of	0,04 mm
<u>Syntax</u>						<u>example</u>
Hy: v (y;C)]	Vz: v(0;z)	Dy;z:	v(y;z)	R: Repe	at
Profil-Markup						
H50 V-3 H40 V	/3 H40 D25	;-20 H25 D25	;20			
outside						
Gatalde				/		
	···,					
→y 1	;					205 mm
A:	<u>0,439</u>	cm²/m		ly:	<u>0,229</u>	cm^4 / m
h1:	<u>14,359</u>	mm		h2:	<u>5,641</u>	mm
			Abbreck	hen	Übern	ehmen

Starting from the left, the face layer "expired" and the alignment (top/bottom; right; diagonal) as well as the distance are defined.

Using the example above:

H50	Horizontally right 50 mm
V-3	Vertically top 3 mm
H40	Horizontally right 40 mm
V3	Vertically down 3 mm
H50	Horizontally right 50 mm
D25;-20	Diagonally 25 mm right and 20 mm top
H25	Horizontally right 25 mm
D25;20	Diagonally 25 mm right and 20 mm down

The letter "R" repeats the entered geometry to a width of 1000 mm.

support reaction capacity of a profiled face		1,1		1	Ψ2	0	0	0 0 a	0

The partial safety factors can be defined here:

Material safetc factors
 The material safety factors accord

The material safety factors according to EN 14509, Tab. E.9 are given as default settings. If necessary, these factors must be adjusted according to the specifications or test results and the national regulations.

è Load factors

At this point the load factors can be predefined. This is a default setting which can still be changed in the course of the design of the element in the "Overall control" mask.

è Combination coefficents

At this point the combination coefficients can be predefined. This is a default setting which can still be changed in the course of the design of the element in the "Overall control" mask.

Index "fixings"

The sandwich panels entered in this module all have the possibility to be fixed directly to the substructure. The corresponding boundary conditions (yield strength, covering layer thickness, sandwich thickness etc.) are taken into account in the mask for selecting the connection with the substructure.

In the Index "fixings" you can now define hidden fixings - here using an example:

🕄 Freie Elementeingabe					×
General details	Upper face layer	Lower face layer	core	partial safty factors	fixings
hidden fastening	plat 100	ks0x3 · S>≈0		- + ×	
variation				_	
plat 100x50x3	. s	>=16	LSP 🗆 interpolation	on el 500 mm delta	0 mm
washer Ø	16 I⊷→I 100 mm	fastener Ø	I⊷→I 7 mm	head of fastener Ø 12 i←→i	12 mm
characteristic			+		.
	under offerlands			MPM/L	+
I.	number of rasteners	2 en:	40 mm	NHVK: 2,5 KN	*
2.	number of fasteners	2 eR:	500 mm	NRVk: 3,80 kN	×
			+		
		gan	cel		add

iS - engineering GmbH 🚞

A new type of hidden fixings is created by selecting "+" at the top. This is followed by the definition of this type:

2		
•	variation	designation of type of hidden fixing
•	LSP	with load spreader plate?
•	Interpolation	In the case of a cantilever arm with a length between the end support and the intermediate support, NRvk may be interpolated. Please refer to the "eR" explanations in the table below.
•	el	At what distance is the intermediate support [mm]
•	delta	Reduction of the sandwich thickness due to the hidden fixing (usually approx. 20 mm). Example:
	washer- diameter	Which wahser diameter is possible? Here as an example: from 16 to 100 mm Note: 0 and 100 mm are only to be regarded as placeholders for fictitious sizes - there is therefore no restriction for the range 0 to 100 mm.
	fastener- diameter	 Which fastener diameter is possible? Here as an example: from 0 to 7 mm Note: 0 and 100 mm are only to be regarded as placeholders for fictitious sizes - there is therefore no restriction for the range 0 to 100 mm.
	diameter head of fastener	 Which diameter of head of fastener is possible? Here as an example: only 12 mm Note: 0 and 100 mm are only to be regarded as placeholders for fictitious sizes - there is therefore no restriction for the range 0 to 100 mm.

iS - engineering GmbH 💻

	charakteristic	
•	number of fasteners	number of fasteners
	eR	 edge distance in [mm] A distinction must be made here between an end support and an intermediate support (eR >= el). Using the example: eR = 40 mm -> this is an end support (with a distance of 40 mm) eR = 500 mm -> this is the intermediate support If the "Interpolation" option is activated and we have a cantilever arm, the resistance value of the concealed attachment between eR and el is interpolated.
•	NRVk	Characteristic value of the hidden fixing in [kN].

Referenc:

All data and boundary conditions must correspond to those of the tests (e.g. according to FprEN 14509-2). The national regulations must be observed if necessary. For Germany, for example, these values are to be regulated within the tests of an German Technical Approval/German Technical Type Approval.
